Department of Artificial Intelligence & Data Science

AY: 2026-27

Class:	TE-AI&DS	Semester:	V
Course Code:	2015111	Course Name:	Statistics for Machine Learning and Data Science Lab

Name of Student:	Madhusudan Jitendra Chanda
Roll No. :	04
Experiment No.:	1
Title of the Experiment:	Perform Exploratory Statistical Analysis of a Real-World Dataset (Case Study)
Date of Performance:	
Date of Submission:	

Evaluation

Performance Indicator	Max. Marks	Marks Obtained
Performance	5	
Understanding	5	
Journal work and timely submission	10	
Total	20	

Performance Indicator	Exceed Expectations (EE)	Meet Expectations (ME)	Below Expectations (BE)
Performance	4-5	2-3	1
Understanding	4-5	2-3	1
Journal work and timely submission	8-10	5-8	1-4

Department of Artificial Intelligence & Data Science

Aim: To perform exploratory statistical analysis of the Pima Indians Diabetes Dataset by examining its structure, variable types, data quality, statistical characteristics, and important patterns.

Objectives

After completing this experiment, the student will be able to:

1. Apply exploratory data analysis techniques to understand the structure and characteristics of a real-world healthcare dataset.
2. Interpret the statistical characteristics, data quality issues, and important patterns identified during the analysis.

Tools Required

- Python 3.x
- Google Colab / Jupyter Notebook
- Pandas
- NumPy
- Matplotlib
- Seaborn

Dataset Details

Dataset: Pima Indians Diabetes Dataset

The dataset contains diagnostic information for female patients and is used to study factors associated with diabetes.

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

The dataset contains 768 observations, 8 input attributes, and one binary outcome variable.

Procedure

1. Load the Pima Indians Diabetes Dataset into a Pandas DataFrame.
2. Examine the dataset dimensions, column names, data types, and sample records.
3. Classify the variables as numerical, categorical, or binary.
4. Generate a statistical summary of the dataset.
5. Check for missing or invalid values.
6. Identify potential outliers using suitable statistical techniques and visualizations.
7. Generate appropriate visualizations to understand the data.
8. Record and interpret important observations obtained from the exploratory analysis.

Description of the Experiment

Exploratory Data Analysis (EDA) is the initial process of understanding a dataset before applying statistical inference or machine learning techniques.

The analysis follows: Raw Dataset, Data Inspection, Variable Identification, Data Quality, Analysis, Statistical Summary, Visualization and Interpretation

The Pima Diabetes Dataset is explored to understand its structure, data quality, variable distributions, and important characteristics before developing predictive models.

Detailed Description of Statistical techniques:

Descriptive Statistics

Statistical measures such as the following are used to summarize numerical variables:

- Mean
- Median
- Minimum
- Maximum

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

- Variance
- Standard Deviation

Missing Value Analysis

The dataset is examined for missing or invalid values.

For example, zero values in certain medical attributes such as **Glucose, BloodPressure, SkinThickness, Insulin, and BMI** may require investigation because a zero value may represent missing or invalid data rather than a genuine medical measurement.

Outlier Analysis

Potentially unusual observations are identified using statistical summaries and visualizations such as boxplots.

An outlier should be investigated before deciding whether it should be removed or retained.

Data Visualization

Suitable visualizations are generated to understand:

- Variable distributions
- Frequency of diabetes outcomes
- Relationships between variables
- Potential outliers

Examples include:

- Histograms
- Boxplots
- Bar charts
- Scatter plots

Conclusion

Exploratory statistical analysis was performed on the Pima Indians Diabetes Dataset to understand its structure, variable characteristics, data quality, and important patterns. The

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

analysis provides the foundation for further statistical analysis and machine learning model development.

Questions to be Answered by Students

1. Which variables in the dataset contain zero or potentially invalid values that require investigation?

ANS: The following variables contain zero values that are physiologically impossible and should be treated as missing or invalid values:

- Glucose
- BloodPressure
- SkinThickness
- Insulin
- BMI

2. Which variable contains potential outliers based on the analysis?

ANS: The Insulin variable contains the most significant outliers, as indicated by boxplot analysis. Other variables such as BMI, SkinThickness, and DiabetesPedigreeFunction also exhibit some outliers, but Insulin has the highest variability and extreme values.

3. What are the important patterns observed between the input variables and the Outcome variable?

ANS: Glucose shows the strongest positive relationship with the Outcome; individuals with higher glucose levels are more likely to have diabetes.

Higher BMI values are associated with a greater likelihood of diabetes.

Older individuals (Age) tend to have a higher probability of being diabetic.

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

Women with a higher number of Pregnancies generally show a higher incidence of diabetes.

DiabetesPedigreeFunction has a moderate positive association with diabetes, indicating the influence of family history.

BloodPressure, SkinThickness, and Insulin exhibit comparatively weaker relationships with the Outcome.

4. State **two important insights** obtained from the exploratory analysis.

ANS: Glucose is the most influential predictor of diabetes, with diabetic patients showing considerably higher glucose levels than non-diabetic patients.

The dataset contains several invalid zero values in medical measurements (Glucose, BloodPressure, SkinThickness, Insulin, and BMI), which should be handled through data preprocessing before building machine learning models to improve prediction accuracy.
